

HEDIS MEASURE CALCULATION & REPORTING REFERENCE ARCHITECTURE

OBJECTIVE

The Healthcare Effectiveness Data and Information Set (HEDIS) is used by health payers to assess and collect data on the performance of providers. As value-based care reimbursement protocols continue to become a mainstay in the healthcare industry, more payers are bringing HEDIS measures to the forefront

DESCRIPTION

- 1 Source Member Enrollment, claims and supplemental data required for HEDIS reporting
- 2 Snowpipe automates ingestion and loading of those datasets into raw base tables
- 3 Snowpark for python, Streams and Tasks cleanses, curates and normalize data
- 4 Curated and harmonized Payer's member, claims and supplemental data is stored as core data products
- 5 HEDIS Measure engine built using Snowpark python deployed as UDF or Stored Procedure calculates measures based on the rules stored in rules database
- 6 Rules database stores HEDIS measure thresholds and conditions
- 7 External rule management portal serves as base for business users to create and manage HEDIS rules to keep it up to date with latest changes
- 8 HEDIS Application presents HEDIS measures, care gaps and provides workflow for business users to action
- 9 Key Supporting Snowflake Functions for HEDIS application
- 10 Dashboards provides views of measures and metrics for detailed analysis
